~taking over 120 years tradition and leading to brilliant, golden future~
Premium Gold Motor (PGM) now available

High efficiency technology inherited from the past created Premium Gold Motor (PGM)

In 1978, 83 years after Toshiba introduced the first domestic induction motor in 1895, we introduced a pioneering high efficiency motor, "Gold Motor." Since then, we have continued to comply many high efficiency motor regulations. Now, we have introduced a new era, premium efficiency motor, "Premium Gold Motor (PGM)" complied with the Top runner scheme.

- 1982 : JEM (Japan Electrical Manufacturers) -TR137 "Totally Enclosed Energy Saving Motors" was enacted.
- 1997 : Energy Policy Act took effect in the US.
- Jul. 2000 : JIS C 4212 "High Efficiency Low Voltage Three Phase Induction Motor" was enacted.
- Dec. 2010 : Energy Independence and Security Act (EISA) took effect.
- Jun. 2011 : EU Regulations (No. 640/2009) took effect.
- Sept. 2012 : China Energy Efficiency Goal Code of Practice (GB3 class) was revised.
- Oct. 2013 : A part of "Energy Saving Act" was revised in Japan.
- Non. 2013 : "Manufacturers' Criteria Regarding Improvement of AC Motors" was enacted by the notice of Ministry of Economy, Trade and Industry.
- Apr. 2015 : Top Runner scheme starts.

Meet the Top runner scheme and comply with IE3 of Japan's three ratings

PGM satisfies targeted standards of Energy Saving Act to start in 2015. PGM also achieved efficiency level IE3 (premium efficiency) set by JIS C 4034-30:2011 for 200V-50Hz, 200/220V-60Hz (as well as 400V class) in Japan.

230V-60Hz as standard to satisfy US high efficiency regulation

4 ratings (200V-50Hz, 200/220/230V-60Hz) are available as standard; 3 ratings for Japan (200V-50Hz, 200/220V-60Hz), 230V-60Hz for US. 230V-60Hz for US complies with Energy Independence and Security Act (EISA) and is certified by Conformity Certification No. (CC No.).

*Not satisfy UL standard.

High Reliability regarding the Characteristics and Performance

Our IE3 motor manufacture plants in Vietnam obtained accreditation by NVLAP and are certified as motor efficiency test shop by NIST, a US institution leading high efficiency motors. Conformity Certification No. (CC No.) by DOE is given only to the test results conducted in certified test shop.

*NIST : National Institute of Standards and Technology
 *NVLAP : National Voluntary Laboratory Accreditation Program
 *DOE : the United States Department of Energy

Compatible with Toshiba standard efficiency motors in the same frame size

PGM has the same frame size as our standard efficiency motors. It is easy to replace existing standard motor with PGM. The total length of PGM is almost the same as that of the standard efficiency motors.

Apply Insulation Class 155 (F) (Temperature Rise B) for All Models, Improve Reliability

Insulation class 155 (F) is applied to all models to hold temperature rise under B rise, which further improves reliability of insulation.

Premium Gold Motor could make great contribution to protect the Green Earth.

Reduces loss by 30~40% compared to our standard efficiency motors,
and increase energy saving effect

PGM can recover the price gap of initial purchase cost between PGM and standard efficiency motor for a short period of time because of 30~40% loss reduction. PGM improved energy saving effects because of much lower running cost than that of the existing high efficiency motor (Gold Motor).

*This is a result of a trial comparison between our standard efficiency motors and our premium gold motor at rated output power. Loss reduction rate and payback period will depend on the usage condition.

Calculating electricity cost The following calculation formula indicates annual electricity cost saved by use of PGM. (Unit: Japanese Yen per year)

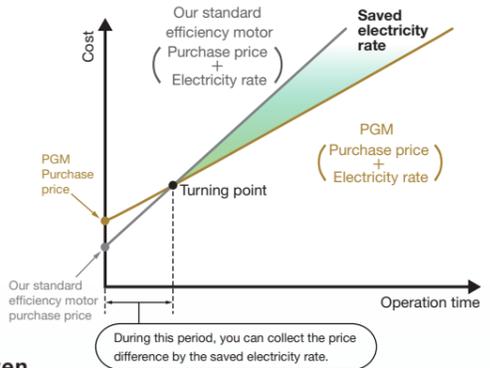

$$S = W \times C \times N$$

- W** = Input power difference between standard efficiency motor and PGM (kW)
(Please see Performance Data for your reference)
- C** = Electric utility rate (Yen/kWh)
*Electric utility rate includes basic rate, taxes, etc., depending on contracted amount of electricity.
- N** = annual operation time (h/year)

<Example>
4poles-3.7kW-200V-50Hz, Operation hours 5,000h/year, Electricity rate 16yen/kWh
W=0.363kW (from the table below), C=16yen/kWh, N=5,000h/year

Saved Electricity Rate S=W×C×N=0.363×16×5,000=29,040yen

*This is just a calculation and not guaranteed. Saved electricity rate will differ by the calculation terms.

Calculating payback period The following calculation formula indicates payback period of the price gap initially purchased between PGM and standard efficiency motor.

$$\text{Payback Period (year)} = \frac{\left[\text{purchase cost of PGM (yen)} \right] - \left[\text{purchase cost of our standard efficiency motor (yen)} \right]}{\text{saved electric utility rate (yen / year)}}$$

More energy saving
with variable speed drive

In addition to energy saving effect at a low speed with VARIABLE SPEED DRIVE, PGM itself further improves energy saving effect.

Allowable torque is improved compared to our standard efficiency motors by loss reduction.

*Allowable torque for 4-Pole or 6-Pole motors: 100% of constant torque operation in 1:10 (6~60Hz); in case of Vector control, 100% of constant torque operation in 1:20 (3~60Hz).

Top mounted terminal box available

To meet the various needs of consumers, top mounted terminal box for motors of frame size 90L or above is available. Upper mounted terminal box shortens overall width of the motors.

Low Noise Levels

Low noise levels with appropriate cooling performance are achieved pursuing appropriate shapes of fans and fan covers by using fluid dynamics.

Even 2-Pole – 60Hz motors satisfy low noise level of less than 80 dB (A).

Support additional options & comply with overseas efficiency regulations.

Additional options—position of terminal box, rotational direction, shaft end screw, mounting direction (shaft up, shaft down, horizontal shaft), corrosion proof, frame earth terminal, etc.—are available. PGM also satisfy overseas regulations. (Please refer to page 27 for details)

IP55 degree of protection for outdoor use.
Improved environmental durability.

PGM for outdoor use have IP55 degree of protection as standard to improve environmental durability. IP55 has better degree of protection from solid objects and water than existing IP44.

Indoor Use/Totally Enclosed Fan Cooled/ Foot Mounted (top mounted terminal box) 0.75kW~55kW

(1) Tolerance of "C" dimensions is 0 - 0.5.
(2) Tolerance of "S" is defined by JIS B 0401(dimensional tolerance); $\phi 19-28\text{mm}$: j6, $\phi 38-48\text{mm}$: k6, $\phi 55\text{mm}$ or longer: m6.
(3) Shaft end key and keyway follow parallel key and keyway of JIS B 1301. Dimensional tolerance of the keyway is standard type (N9).
(4) The followings are standard drive systems; 2-Pole: direct-coupled, 4-Pole: belt-driven. Please contact us for more information about belt application.
(5) Sealed ball bearing is equipped as standard.
(6) Frame size 90L or less motors are not equipped with eye bolts.
(7) The following models are not equipped with baffle plate; 2-Pole: 22, 30kW, 4-Pole: 18.5, 22, 30, 37, 45kW, 6-Pole: 15, 18.5, 22, 30, 45kW.

(1) Tolerance of "C" dimensions is 0~0.5. (2) Tolerance of "S" is defined by JIS B 0401(dimensional tolerance); φ19~28mm:j6, φ38~48mm:k6, φ55mm or longer:m6.
(3) Shaft end key and keyway follow parallel key and keyway of JIS B 1301. Dimensional tolerance of the keyway is standard type (N9).
(4) Tolerance of "LB" dimension is j6 of JIS B 0401. (5) Sealed ball bearing (greased sealed method) is equipped as standard.
(6) Frame size 80M motors are not equipped with eyebolts.

Structural drawing

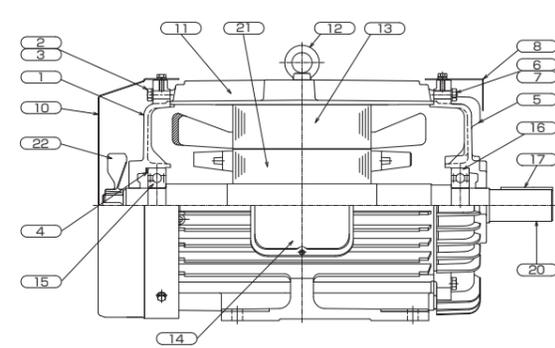

① Indoor use/Steel sheet frame
Foot mounted/Horizontal (Fr.80M)

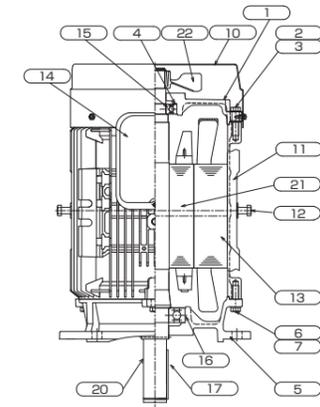

② Indoor use/Aluminum die-cast frame
Foot mounted/Horizontal (Fr.90L~Fr.160L)

③ Indoor use/Cast iron frame
Foot mounted/Horizontal (Fr.180M~Fr.225S)

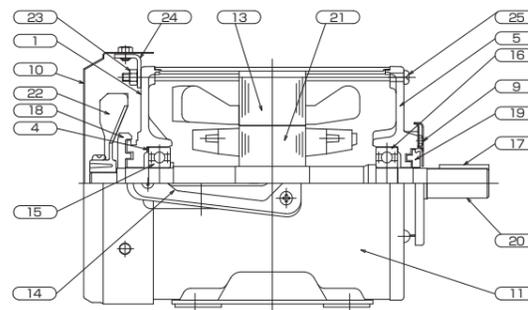

④ Indoor use/Aluminum die-cast frame
Flange mounted/Vertical shaft down
(Fr.90L~160L)

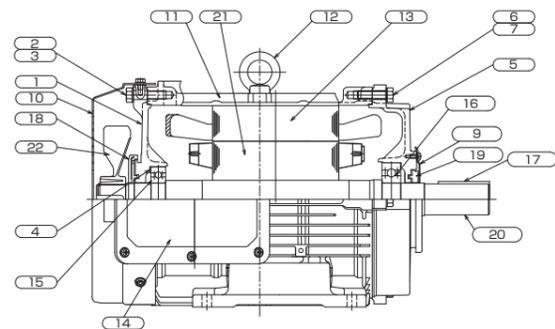

Parts number	Parts name

Wiring

- Please comply with electric installation engineering standards, interior wiring regulations, and regulation by power companies. If wiring distance is too long, voltage drops greatly and motors may not be able to start operating. Please ensure voltage drop in wiring is within 2%.
- The followings show standard connections of motor's lead wire.

Number of terminals for lead wire	Connection method of lead wire			
3	Frame size 80M~112M			
	<p>Direct-on-line starting</p> <p>Inside wiring</p> <p>Electric power source</p>			
6	Frame size 132S~160L	Frame size Over 180M		
	<p>Inside wiring</p> <p>Short-circuit plate</p> <p>Direct-on-line starting</p> <p>Wye-delta starting</p> <p>Wye-delta starter</p> <p>Electric power source</p> <p>Inside wiring</p> <p>*(When connected to a wye-delta starter, please take off the short circuit board.)</p> <p>(6P-3.7kW is direct-on-line starting.)</p>	<p>Wye-delta starting</p> <p>Direct-on-line starting</p> <p>To wye-delta starter</p> <p>To electric power source</p>		
12	Common for 200V class/400V class			
	Direct-on-line starting		Wye-delta starting	
	200V class	400V class	200V class	400V class
	<p>Electric power source</p>	<p>Electric power source</p>	<p>Wye-delta starter</p>	<p>Wye-delta starter</p>
<p>Marked terminal (Lead wire draw out point)</p>				

3. Precautions for use of wye-delta starting

Please ensure turning off power switch in 2 contactors method if using wye-delta starting.

If the switch is turned on, motors keep being supplied with voltage, which may cause deterioration of motor's insulation or burnout. It doesn't happen in 3 contactors method.

Note) 1. There are 4 moving discount bolts in figure 2 and 3.
 2. No base bolt attached.
 3. The () measurement are recommended measurement when base bolts are used.
 4. * marks are for totally enclosed fan cooled 160M, 160L only.

Global series

(Please contact us for more information.)

• US series

US series satisfy Premium Efficiency or Energy Efficient of Energy Independence and Security Act (EISA).

The series are certified by Conformity Certification No. (CC No.)

*The series do not satisfy UL standards.

• Chinese series

China series satisfy grade GB2 of CEL-007.

*The series do not satisfy CCC mark.

• European (EU) Series

Europe (EU) series satisfy Commission Regulation (EC) No. 640/2009.

The series satisfy IE3 Efficiency and also CE Marking.

• Russian Series

Russian series satisfy EAC certification for low voltage motor.

Selection and application of motors for energy saving

To save electricity effectively, it is necessary to consider various perspectives about each item of selection, operation, and maintenance. When selecting motors, first decide voltage, frequency, number of poles, output power, frequency of use, and mounting method.

In addition, it is necessary to decide ambient conditions, connection methods with load, and mechanical options.

Power supply

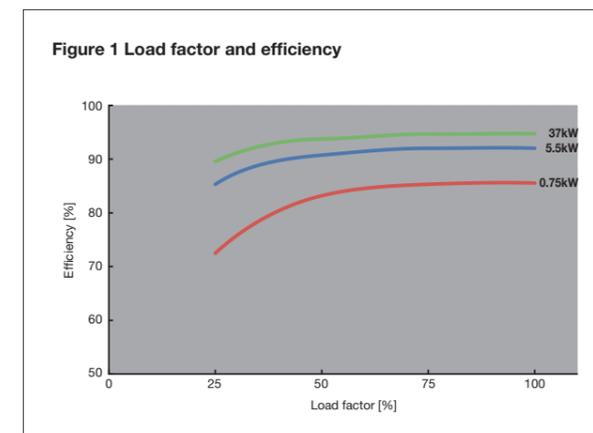

Motors are designed to have their best performance when operating according to rated voltage and rated frequency displayed on the nameplates. To avoid using in different condition from nameplates leads to an effective energy saving.

Efficiency of motors

Efficiency of motors is ratio of output to input. When selecting motors, please carefully consider load factor, output power, and number of poles as mentioned below;

1. Load factor and efficiency

As Figure 1 shows, motors generally have maximum efficiency with 75%~100% of load factor. Thus, if the motors are operated in this range, it would save energy the most. If load factor is too low, motors may have to be reconsidered.

2. Output power and efficiency

As Figure 1 indicates, efficiency of motors in rated load (100% of load factor) becomes higher as the motor capacity becomes large. However, as mentioned above, efficiency is low when using motors in low load factor. It is necessary to consider the load carefully and decide the motor capacity. Also, to reduce power loss due to idle running of motors, it may need to stop operating the motors when they are not used.

3. Rotational speed and efficiency

Efficiency of motors generally depends also on the speed. If load is fixed, the number of poles and speed will be decided considering the usage of saving electricity, efficiency of deceleration devices, etc.

Also, if motors need to operate in variable speed, VARIABLE SPEED DRIVE is necessary to control operation for various load change.

Precaution when using high efficiency motors

High efficiency motors generally rotate faster than standard efficiency motors because of generated loss reduction.

If standard efficiency motors are replaced by high efficiency motors in pump, fan, etc. applications, the rotational speed becomes faster and the output increases.

Although efficiency of motors is high, power consumption may increase with increased output power.

Also, primary and secondary resistance may be decreased to reduce copper loss, which results in high starting current compare to standard efficiency motors. In that case, breaker may have to be changed.

Toshiba Variable Speed Drive series

Plentiful variations, from simply adjustable speed control to vector control

Notes in case operating motors with variable speed drive (VSD)

Starting characteristics

When a motor is driven by VSD, its operation is restricted by the VSD's overload current rating, so the starting characteristic is different from those obtained from commercial power supply operation.

Although the starting torque is smaller with VSD than with the commercial power supply, a high starting torque can be produced at low speeds by adjusting the V/f pattern torque boost amount or by employing vector control.

(It depends on motor specification and setting of VSD (maximum 200%)), When a larger starting torque is necessary, select VSD with a larger capacity and examine the possibility of increasing the motor capacity.

Noise

The magnetic noise of motor with VSD drives is larger than operated by the commercial supply. Moreover, when the motors are operated over rated speed, the windy noise of the motors increases.

Vibration

(1) Toshiba VSD uses sine wave PWM control and the vibration is small. However, it experiences more vibrations than operated by the commercial power supply.

(2) Vibration may increase by base rigidity and resonance with machine etc. In such case, it may be necessary to take countermeasures mechanically such as change of base and motor coupling, etc.

Gear, belt, chain

(1) When oil lubricated gear use, lubrication may become worst at low speed.

(2) When operating at frequencies exceeding 60 Hz, power transmission mechanisms such as gear, belts and chains, etc., may cause problems such as production of noise, a reduction in strength, or shortening of service life.

(3) When running with VSD, please contact us to confirm if the operating range is tolerance.

Increase of operating frequency

Before setting the maximum frequency to 60Hz or higher, please contact us to confirm that this operating range is tolerance for the motor.

Motor end surge voltage suppression

In the system of operating 400V class high efficiency motor driven by the voltage type PWM VSD using super high-speed switching device (e.g. IGBT), insulation degradation of motor wiring may occur by the cable length, cable installation method and the cable type. In this case, the following countermeasures are suggested.

• In case of normal insulation motor

Suppress the surge voltage by AC reactors or surge suppression filter to keep surge voltage at motor terminal below 850V.

• In case of enhanced insulation type of motor

Permissible surge voltage of motor is 1250V or less. When surge voltage is generated more than 1250V, suppress the surge voltage by AC reactors or surge suppression filter at load side of VSD.

Input voltage

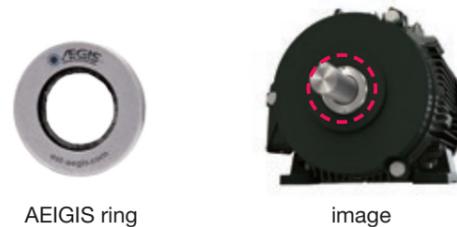

When input voltage becomes remarkably low due to vector control etc., consider using dedicated motor. In case the surge voltage becomes larger than permissive voltage, install AC reactors or surge suppression filter at load side of VSD.

Electric corrosion in the ball bearing

When a motor is driven by a VSD, electric corrosion may happen due to sealed grease condition of bearing, wiring method or operation conditions.

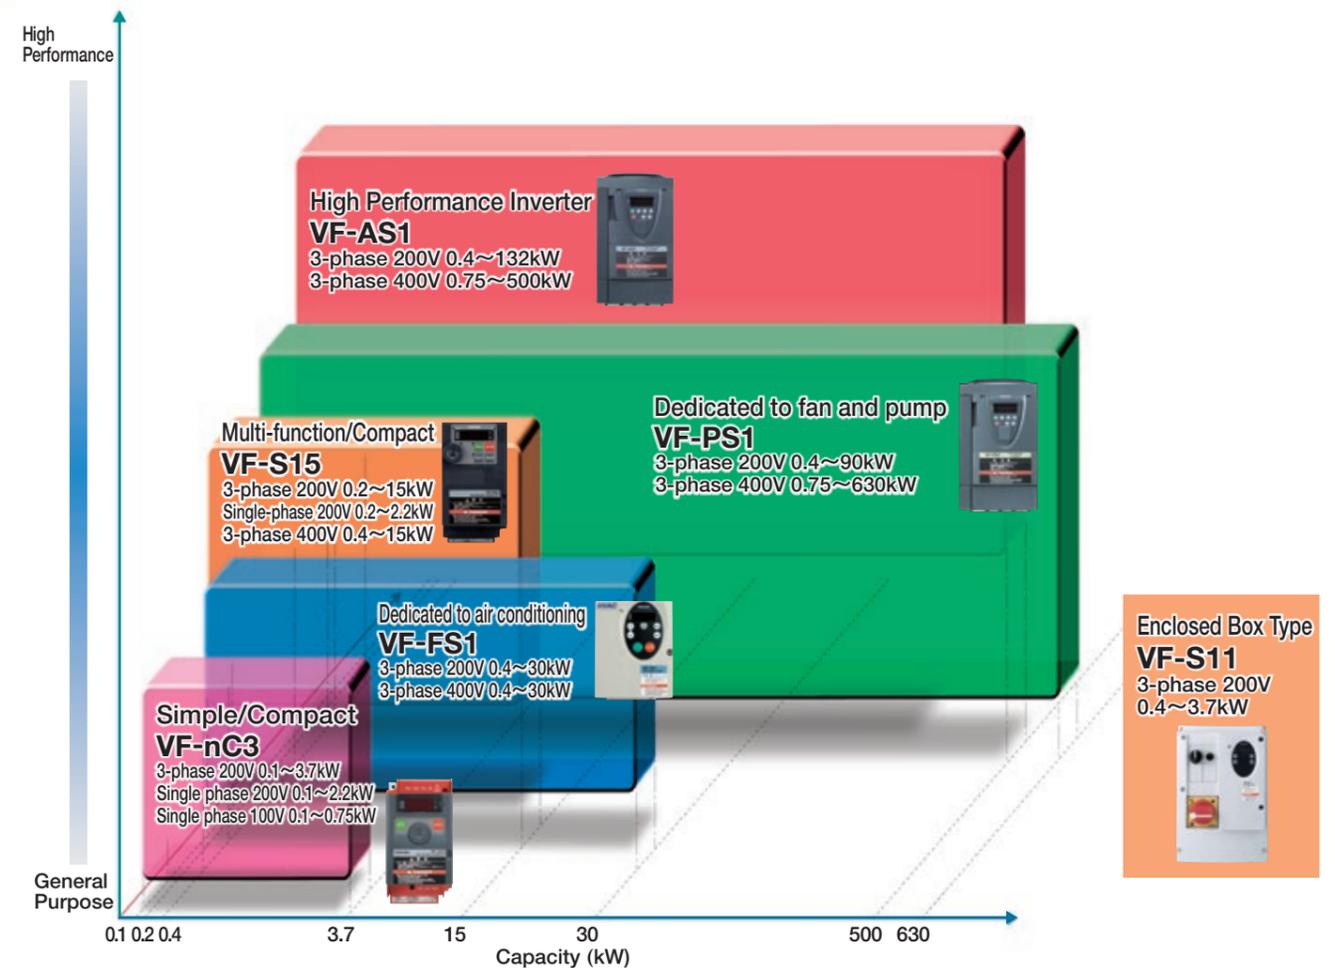

Please contact us if you need any countermeasures. We have prepared AEGIS ring as an option, which is expected to lower shaft voltage.

(Countermeasures to motor to prevent electric corrosion are not provided without customer's request.)

AEGIS ring

	3-phase 400V	0.4~30kW															
VF-PS1	3-phase 200V	0.4~90kW	120%-one minute		●	●	●	●	●								
	3-phase 400V	0.75~630kW															

*1: Optional.

For users of the products : Our variable speed drives are designed to control the speeds of three-phase motors for general industry.

Precautions

- * If you are using the motor on equipment that could seriously affect human lives or public functions (such as nuclear power control, traffic machinery, transport machinery, life-support system, chemical plant, various types of safety equipment, etc.), please contact us for consultation.
- * Though Toshiba's motors are made under a strict quality control, due to the environment and conditions, there is a possibility of malfunctioning. Please create a failsafe or back-up system on the equipment design, if there is any possibility of serious damage when the motor's malfunction.
- * The usage environment's limit range is stated in the catalog and manual. Please do not use it out of the usage environment range. It could cause accidents such as injuries and fire.
- * Please read the manual's safety instructions, and use the motor correctly.
- * If the motors are used for personal transports or elevators, please establish a protection device for safety of the equipping side.
- * Contact to your nearest Toshiba representative in advance if you are to use the product in a clean room or for a food product machine. If you use a standard product to which a special treatment has not been made, grease and oil may leach out of the spigot joint and the shaft pass-through part of the bearing bracket and the stator frame. You need to pay attention when using the product in a place where oil should not be spilled.

For further information, please contact your nearest Toshiba Representative.
The information in this brochure is subject to change without notice.
